

CogBias-MT evaluation schema — 5 judgment lines per subject response

Self-pair handling

When the panel judge is the subject itself (a frontier model judging its own response), that cell is a **self-pair**: retained in the released raw data, but excluded from all cross-evaluation aggregates (Table VII strictness).

7 subjects × 2 languages × 80 problems × 5 lines = 5,600 judgments

= 1,120 self-evaluations + 4,480 panel evaluations

Pairwise disagreement (Fig. 2 / Table II) uses the common 7-subject set; per-evaluator strictness (Table VII) excludes self-pairs.
